This article reports on a system that was developed as a tool for monitoring of the water environment in the vicinity of a wastewater treatment plant. The system was designed to provide quick and easy monitoring of parameters affecting the water quality in the catch basin where sewage and treated waste water from the plant are collected. The system is based on information technology and provides the possibility to measure, process and analyse data from several different sources. It also gives the possibility to create a continuous water environment picture. The system was developed at wastewater treatment plant in Trondheim. The system was evaluated for the first year of operation, during which data was gathered from six different sources; process data (from process analysers), user data (from measurement stations) and control data (from electronic control systems). Data from the user stations was used for development of graphical displays, which allowed for quick overview of the data. The process analysers data was used for controlling and optimizing the treatment process. The control data was used for monitoring of the sensor system, which was found to be highly reliable. The system was found to be useful in identifying problems, optimizing the process and adjusting the system. The system was used to measure average peak period temperatures during different seasons and the occurrence of storm events and sewage overflow in the catch basin and was found to be a useful tool for control.Dec. 2, 2012 -- You may never wash a towel or wash clothes again.
